

Evolution of flagellin perception in Arabidopsis thaliana and its relatives

Filesize: 1.09 MB

Reviews

These kinds of pdf is the ideal ebook accessible. Of course, it is actually play, nevertheless an interesting and amazing literature. I realized this publication from my i and dad suggested this book to find out.

(Ms. Ruth Wisozk)

EVOLUTION OF FLAGELLIN PERCEPTION IN ARABIDOPSIS THALIANA AND ITS RELATIVES

DOWNLOAD

Cuvillier Verlag Aug 2010, 2010. Taschenbuch. Condition: Neu. Neuware - Plants are constantly challenged by microbes which try to gain fitness benefits at the cost of their host. Microbes which may putatively cause disease are therefore detected by plant receptors that bind pathogen-associated molecular patterns (PAMPs). The peptide flg22 resembles the most conserved part of the N-terminus of bacterial flagellin and is perceived as a PAMP by the pattern recognition receptors (PRR) FLAGELLIN-SENSING 2 (FLS2) in all higher plant species. Upon perception of flg22, FLS2 elicits PAMP-triggered immunity (PTI) and thus contributes to host survival and fitness. While the evolution of resistance (R) genes has been extensively examined, no detailed studies on the evolution of PRRs are available, although this information may improve pest management in crops. Here, functional variation of FLS2 in *A. thaliana* and its relatives within the Brassicaceae was investigated. Differences in FLS2 protein abundance but no major changes in affinity of FLS2 towards flg22 cause functional diversity in accessions of *A. thaliana*. Duplication of the FLS2 gene in *A. lyrata* contributes to a large variation in flg22 perception in this species. FLS2 functional variation correlates with bacteria load in the plant mesophyll. Despite this beneficial contribution to Darwinian fitness, functional variation segregates within populations of *A. thaliana*. The intraspecific variation in flg22 perception in *A. thaliana* is as pronounced as among several Brassicaceae species. This suggests that FLS2 is not subjected to directional selection towards a general optimum of receptor function but flg22 perception is a quantitative trait in the Brassicaceae family. Using genetic and quantitative population differentiation to detect natural selection, no conclusive evidence could be found that evolution of flg22 perception is driven by the adaptation to local flg22 variants as has been demonstrated for highly specific gene-for-gene interaction of R genes and their...
